July 15, 2026

Dear Hiring Manager,

I build teams that make products. That is the shortest honest summary of my career, and it is what I would bring to your organization: ownership of a product from the top down — architecture, strategy, customers — backed by a full, hands-on understanding of what it takes to deliver it from the bottom up.

That bottom-up understanding was earned layer by layer. I started at the test bench — certifying consumer electronics at Intertek, then spending three years at G3 Technologies debugging cellular protocols across four generations of wireless standards, down to the RF physical layer and Qualcomm chipset logs. At L3Harris I moved up the stack to own requirements for a new Radar Warning Receiver program, engaging prime customers directly. At Lockheed Martin that arc has continued: from defining 5G Non-Terrestrial Network architecture, to closing the first LTE GEO satellite system, to demonstrating the world's first 5G VPX CMOSS system with open-source software. Today, as 5G Systems Integration & Test Lead, I am the product owner for O-RAN and Tactical MANET deployments — setting technical direction, directing sub-contractor teams, and traveling to integrate on-site with internal and external customers. When I make a top-down architectural call, I know exactly what it costs at every layer beneath it, because I have worked those layers myself.

I invest in long-term strategies for products, not short-term wins — and I hold myself to the same standard. While working full time, I earned my PE license, my PMP, and a master's in wireless communications, and I am completing a PhD in Systems Engineering at Stevens Institute of Technology. That research is not a side pursuit; it feeds the products. Tracking 3GPP standards working groups let me position our NTN architecture for where the standard was heading, and my published work with collaborators — five IEEE papers, including a MILCOM Poster Session Honorable Mention — reflects how I work: as part of a team, building things that outlast a single program. I believe deeply in team culture, because durable products are made by teams that trust each other, and building that trust is a leader's job, not a byproduct.

Building is also simply what I do. Outside of work I designed, built, and continue to iterate on an open-source RF mesh-network planning tool for Fresnel-zone analysis — my own product, owned end to end, from the terrain-elevation math to the user interface.

I would welcome the chance to talk about how that combination — top-down product ownership, bottom-up technical depth, and a genuine investment in teams — could serve your organization.

Sincerely,

Eric Forbes
